

Vaccine Reconstitution

Diluents are specifically designed for the needs of each vaccine, with respect to volume, pH and chemical properties.

Reconstitution Facts

- Only diluents supplied by the manufacturer, specific for the vaccine should be used - **no other diluents may be used**
- The diluents supplied is part of the licensed product and is specific for that vaccine
- Not all diluents are sterile water - this is a common misconception!
- Diluents may contain stabilizers that affect heat stability
- Diluents may contain chemicals to assist in dissolving the vaccine to a liquid state
- Diluents may contain buffers to ensure the correct acidic balance of the mixture
- Diluents may contain bactericides to maintain sterility after reconstitution
